and James S. McDonnell Foundation grant #220020045 BBMB

January 5, 2006

Introduction

- ▶ American English /ɹ/:
a variety perceptually indistinct production strategies
(Delattre and Freeman 1968, Tiede et al. 2004).
 - ▶ bunched
 - ▶ retroflex
 - ▶ etc.

Introduction

- ▶ Individual speakers employ multiple strategies (e.g., Delattre and Freeman 1968, Ong and Stone 1998, Guenther et al. 1999, Campbell et al. 2004).

Introduction

- ▶ Individual speakers employ multiple strategies (e.g., Delattre and Freeman 1968, Ong and Stone 1998, Guenther et al. 1999, Campbell et al. 2004).
- ▶ We present ultrasound data showing that speakers with more than one distinct /ɹ/ production strategy often:
 - ▶ use each “allophone” consistently in different contexts
 - ▶ do so in the interest of articulatory ease, and
 - ▶ differ quite a bit from one another.

The punch line

/ɹ/ allophony is peculiar because it is unable to reach a stage of conventionalization.

The punch line

/ɹ/ allophony is peculiar because it is unable to reach a stage of conventionalization.

- ▶ Speaker-specific allophony patterns.

The punch line

/ɹ/ allophony is peculiar because it is unable to reach a stage of conventionalization.

- ▶ Speaker-specific allophony patterns.
- ▶ Complex allophony patterns:

The punch line

/ɹ/ allophony is peculiar because it is unable to reach a stage of conventionalization.

- ▶ Speaker-specific allophony patterns.
- ▶ Complex allophony patterns:
 - ▶ Different conditioning segments for different syllable positions

The punch line

/ɹ/ allophony is peculiar because it is unable to reach a stage of conventionalization.

- ▶ Speaker-specific allophony patterns.
- ▶ Complex allophony patterns:
 - ▶ Different conditioning segments for different syllable positions
 - ▶ Different conditioning consonants for different vowel contexts

The punch line

/ɹ/ allophony is peculiar because it is unable to reach a stage of conventionalization.

- ▶ Speaker-specific allophony patterns.
- ▶ Complex allophony patterns:
 - ▶ Different conditioning segments for different syllable positions
 - ▶ Different conditioning consonants for different vowel contexts
 - ▶ Sets of conditioning environments that are not easily defined.

Introduction

We argue that these facts show that:

Introduction

We argue that these facts show that:

- ▶ multiple sound patterns can emerge in response to the same phonetic motivation,

Introduction

We argue that these facts show that:

- ▶ multiple sound patterns can emerge in response to the same phonetic motivation,
- ▶ speakers can control complex allophonic rules,

Introduction

We argue that these facts show that:

- ▶ multiple sound patterns can emerge in response to the same phonetic motivation,
- ▶ speakers can control complex allophonic rules,
- ▶ the simplification characteristic of many familiar sound patterns appears to be the result of social convergence on a single conventionalized pattern, and

Introduction

We argue that these facts show that:

- ▶ multiple sound patterns can emerge in response to the same phonetic motivation,
- ▶ speakers can control complex allophonic rules,
- ▶ the simplification characteristic of many familiar sound patterns appears to be the result of social convergence on a single conventionalized pattern, and
- ▶ this convergence cannot occur here because the difference between allophones is imperceptible.

Introduction

- ▶ This interpretation is consistent with the view that phonetically natural sound patterns and their characteristic properties emerge through the conventionalization of phonetic effects

Introduction

- ▶ This interpretation is consistent with the view that phonetically natural sound patterns and their characteristic properties emerge through the conventionalization of phonetic effects
- ▶ (e.g. (recently) Ohala 1981, 2003, Ladefoged 1984, Labov 1994, 2001, Bybee 1998, Hume and Johnson 2001, Hale 2003, Janda 2003, Janda and Joseph 2003, Kiparsky 2003, Blevins 2004, etc. . .).

Introduction

- ▶ This interpretation is consistent with the view that phonetically natural sound patterns and their characteristic properties emerge through the conventionalization of phonetic effects
- ▶ (e.g. (recently) Ohala 1981, 2003, Ladefoged 1984, Labov 1994, 2001, Bybee 1998, Hume and Johnson 2001, Hale 2003, Janda 2003, Janda and Joseph 2003, Kiparsky 2003, Blevins 2004, etc. . .).

Introduction

- ▶ This interpretation is consistent with the view that phonetically natural sound patterns and their characteristic properties emerge through the conventionalization of phonetic effects

The retroflex /ɹ/ types

Apical retroflex

Type 7

Classic retroflex

Type 8

Methods overview

- ▶ Subjects were recorded producing English words containing /ɹ/ (audio, video, and ultrasound video)
- ▶ Stimuli were monosyllabic words with /ɹ/ in different syllabic and segmental contexts.
- ▶ Produced in the carrier phrase “Please say X again.”

Stimuli

Segments:

- ▶ Vowels in stimuli were /a o i/.
- ▶ Preceding /ɹ/ were /p t k f ʃ θ/ and #.
- ▶ Following /ɹ/ were /p t k f tʃ θ l/ and #.

Words (subject to the existence of words):

- ▶ 3 words for each C__V & V__C context (92)
- ▶ 5 words for each initial & final context (30)
- ▶ 1 word for each C__C context (25) (many gaps)

All words repeated 3 times.

Subjects

- ▶ 32 University of Arizona undergraduates
- ▶ 5 subjects excluded from analysis (4 non-native speakers of American English and 1 who imaged very poorly)
- ▶ 27 subjects analyzed

Analysis of tokens

- ▶ 441 tokens (3×147) per subject analyzed:
 - ▶ visual inspection of ultrasound images
 - ▶ visual inspection of ultrasound video
 - ▶ with and without Palatron tongue-palate alignment (Mielke et al. 2004).
- ▶ Each token labeled according to Delattre and Freeman's (1968) taxonomy.

Average retroflexion rates for prevocalic /ɹ/ (11 subjects)

Generalizations: prevocalic /ɹ/

Retroflexion rates:

- ▶ (C)ra, (C)ro > (C)ri

Generalizations: prevocalic /ɹ/

Retroflexion rates:

- ▶ (C)ra, (C)ro > (C)ri
- ▶ #rV, prV, frV > krV, jrV, trV, θrV

Generalizations: prevocalic /ɹ/

Retroflexion rates:

- ▶ (C)ra, (C)ro > (C)ri
- ▶ #rV, prV, frV > krV, ʃrV, trV, θrV
- ▶ ʃri, tri, θri = zero

Generalizations: prevocalic /r/

Retroflexion rates:

- ▶ (C)ra, (C)ro > (C)ri
- ▶ #rV, prV, frV > krV, jrV, trV, θrV
- ▶ ʃri, tri, θri = zero

Discourage retroflexion:

- ▶ high front vowel
- ▶ lingual consonants, especially coronals

Average retroflexion rates for postvocalic /ɹ/ (11 subjects)

Generalizations: postvocalic /ɹ/

Retroflexion rates:

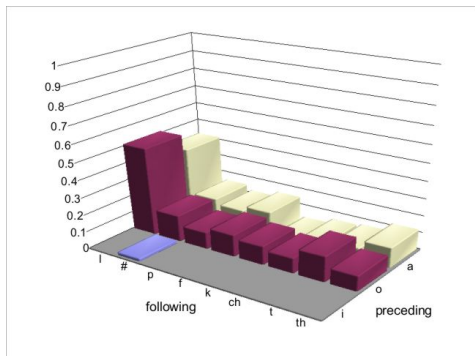

- ▶ low overall

Generalizations: postvocalic /ɹ/

Retroflexion rates:

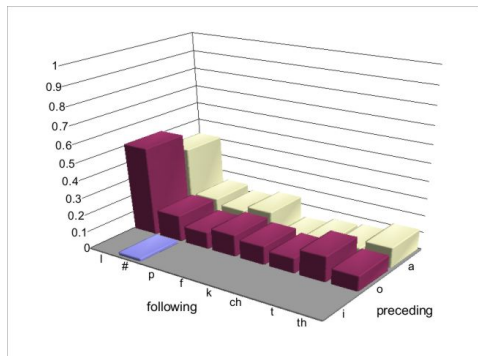

- ▶ low overall
- ▶ highest Vrl

Generalizations: postvocalic /ɹ/

Retroflexion rates:

- ▶ low overall
- ▶ highest Vrl
- ▶ ar(C), or(C) > ir(C)

Average retroflexion rates for syllabic /ɹ/ (11 subjects)

Generalizations: syllabic /ɹ/

Retroflexion rates:

- ▶ low overall

Generalizations: syllabic /ɹ/

Retroflexion rates:

- ▶ low overall
- ▶ highest (C)rl

Generalizations: syllabic /ɹ/

Retroflexion rates:

- ▶ low overall
- ▶ highest (C)rI
- ▶ higher prV, frV

Summary of results so far

- ▶ Average retroflexion rates are highest before vowels and /l/.

Summary of results so far

- ▶ Average retroflexion rates are highest before vowels and /l/.
- ▶ Average retroflexion rates next to different segments are phonetically sensible:

Summary of results so far

- ▶ Average retroflexion rates are highest before vowels and /l/.
- ▶ Average retroflexion rates next to different segments are phonetically sensible:
 - ▶ Less retroflexion next to segments that place demands on the tongue that are antagonistic with retroflexion

Summary of results so far

- ▶ Average retroflexion rates are highest before vowels and /l/.
- ▶ Average retroflexion rates next to different segments are phonetically sensible:
 - ▶ Less retroflexion next to segments that place demands on the tongue that are antagonistic with retroflexion
 - ▶ More retroflexion where segments do not interfere or where tongue body position is compatible with retroflexion

Categorical retroflexion

- ▶ Nine speakers have some environments with 100% retroflexion.

Categorical retroflexion

- ▶ Nine speakers have some environments with 100% retroflexion.
- ▶ r19 retroflexes everywhere but \int ri, tri, θ ri

Categorical retroflexion

- ▶ Nine speakers have some environments with 100% retroflexion.
- ▶ r19 retroflexes everywhere but \int ri, tri, θ ri
- ▶ often bunches \int ro, tro, θ ro

Systematic gaps

- Some speakers have systematic gaps.

Systematic gaps

- ▶ Some speakers have systematic gaps.
- ▶ r08 doesn't retroflex in frV

Systematic gaps

- ▶ Some speakers have systematic gaps.
- ▶ r08 doesn't retroflex in frV
- ▶ almost never retroflexes in Cri

Systematic gaps

- ▶ Other speakers have *other* gaps.

Systematic gaps

- ▶ Other speakers have *other* gaps.
- ▶ r17 doesn't retroflex in krV or θrV

Systematic gaps

- ▶ Other speakers have *other* gaps.
- ▶ r17 doesn't retroflex in krV or θrV
- ▶ but *does* retroflex in jrV

Sporadic retroflexion

- ▶ Three speakers have only sporadic retroflexion.

Sporadic retroflexion

- ▶ Three speakers have only sporadic retroflexion.
- ▶ r01 has some retroflexion in #ra

Sporadic retroflexion

- ▶ Three speakers have only sporadic retroflexion.
- ▶ r01 has some retroflexion in #ra
- ▶ and occasional retroflexion in #ro, fra, fro

Retroflexion before liquids

- ▶ Only eight subjects retroflex postvocalic or syllabic /ɹ/.

Retroflexion before liquids

- ▶ Only eight subjects retroflex postvocalic or syllabic /ɹ/.
- ▶ Four of these retroflex only before /l/

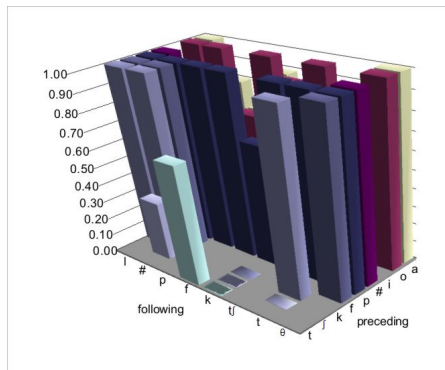

Retroflexion before liquids

- ▶ Only eight subjects retroflex postvocalic or syllabic /ɹ/.
- ▶ Four of these retroflex only before /l/
- ▶ r19 retroflexes in all pre-liquid contexts.

Retroflexion before other consonants

- ▶ Only four subjects regularly retroflex before any other consonants.

Retroflexion before other consonants

- ▶ Only four subjects regularly retroflex before any other consonants.
- ▶ r22 retroflexes in most nonprevocalic contexts.

Retroflexion before other consonants

- ▶ Only four subjects regularly retroflex before any other consonants.
- ▶ r22 retroflexes in most nonprevocalic contexts.
- ▶ but never in krk, frk, trk, or frt

/ɹ/ allophony rules are...

- ▶ phonetically natural
- ▶ speaker-specific
- ▶ complex

/ɹ/ allophony rules are **phonetically natural**

- ▶ Bunched /ɹ/ typically occurs next to “bunched” consonants and vowels.

/ɹ/ allophony rules are **phonetically natural**

- ▶ Bunched /ɹ/ typically occurs next to “bunched” consonants and vowels.
- ▶ Retroflex /ɹ/ typically occurs in contexts without antagonistic tongue shapes.

More bunching next to linguals and [i]

- ▶ [ʃ], [k], and [i] all involve essentially a “bunched” tongue body.

More bunching next to linguals and [i]

- ▶ [ʃ], [k], and [i] all involve essentially a “bunched” tongue body.
- ▶ Retroflexion is rare in these contexts:
e.g., r08’s “shriek”

More bunching next to linguals and [i]

- ▶ [ʃ], [k], and [i] all involve essentially a “bunched” tongue body.
- ▶ Retroflexion is rare in these contexts:
e.g., r08’s “shriek”
- ▶ ... but not impossible: r30’s “shriek”.

Retroflexion next to labials, word boundary back vowels

Retroflexion next to labials, word boundary back vowels

- ▶ Labials do not interfere with retroflexion or provide free bunching.

Retroflexion next to labials, word boundary back vowels

- ▶ Labials do not interfere with retroflexion or provide free bunching.
- ▶ For retroflex /ɻ/, the tongue body is back, as for a back vowel.

Retroflexion next to labials, word boundary back vowels

- ▶ Labials do not interfere with retroflexion or provide free bunching.
- ▶ For retroflex /ɻ/, the tongue body is back, as for a back vowel.
- ▶ Retroflexion is more common here: r08's "frog".

Retroflexion before /l/

- ▶ More retroflexion before /l/ than before any other consonant.

Retroflexion before /l/

- ▶ More retroflexion before /l/ than before any other consonant.
- ▶ The syllable structure of words with Vrl is ambiguous (e.g., 'Carl', 'curl', 'whorl').

Retroflexion before /l/

- ▶ More retroflexion before /l/ than before any other consonant.
- ▶ The syllable structure of words with Vrl is ambiguous (e.g., 'Carl', 'curl', 'whorl').
- ▶ Mixed results: 8 of 13 subjects who retroflex before vowels also retroflex before /l/.

Retroflexion before /l/

- ▶ More retroflexion before /l/ than before any other consonant.
- ▶ The syllable structure of words with Vrl is ambiguous (e.g., 'Carl', 'curl', 'whorl').
- ▶ Mixed results: 8 of 13 subjects who retroflex before vowels also retroflex before /l/.
- ▶ Consistent with other findings relating /l/'s phonetic ambiguity to mixed phonological behavior (e.g. Mielke 2005).

/ɹ/ allophony rules are **speaker-specific**:

- ▶ Different reactions to the same phonetic motivations

/ɹ/ allophony rules are **speaker-specific**:

- ▶ Different reactions to the same phonetic motivations
- ▶ Responses to different speaker-specific phonetic motivations

Different reactions to the same motivations

These are different from typical sound patterns.

These are different from typical sound patterns.

We do not typically see:

- ▶ such a wide range of speaker-specific interpretations of a phonetically-motivated sound pattern.

These are different from typical sound patterns.

We do not typically see:

- ▶ such a wide range of speaker-specific interpretations of a phonetically-motivated sound pattern.
- ▶ such complex conditioning environments.

These are different from typical sound patterns.

We do not typically see:

- ▶ such a wide range of speaker-specific interpretations of a phonetically-motivated sound pattern.
- ▶ such complex conditioning environments.
- ▶ sound patterns that respect each speaker's idiosyncratic articulatory needs.

But apparently these types of patterns are *possible*.

Why is /ɹ/ allophony different?

- ▶ The difference between allophones is inaudible.

Why is /ɹ/ allophony different?

- ▶ The difference between allophones is inaudible.
- ▶ Speakers cannot converge on a common rule because no one knows what anyone else is doing.

Why is /ɹ/ allophony different?

- ▶ The difference between allophones is inaudible.
- ▶ Speakers cannot converge on a common rule because no one knows what anyone else is doing.
- ▶ Social convergence has been linked to the simplification of sound patterns (e.g., Trudgill 2002)

Why is /ɹ/ allophony different?

- ▶ The difference between allophones is inaudible.
- ▶ Speakers cannot converge on a common rule because no one knows what anyone else is doing.
- ▶ Social convergence has been linked to the simplification of sound patterns (e.g., Trudgill 2002)
- ▶ Social convergence on an /ɹ/ allophony pattern might:
 - ▶ iron out speaker-specific articulatory differences,
 - ▶ tend to favor an easily learned variant.

If /ɹ/ allophony grew up. . .

Possible “ironed out” conventionalized /ɹ/ allophony patterns:

If /ɺ/ allophony grew up. . .

Possible “ironed out” conventionalized /ɺ/ allophony patterns:

- ▶ /ɺ/ is retroflex in onsets (like English /l/).

If /ɹ/ allophony grew up. . .

Possible “ironed out” conventionalized /ɹ/ allophony patterns:

- ▶ /ɹ/ is retroflex in onsets (like English /l/).
- ▶ /ɹ/ is retroflex next to labials and word boundaries.

If /ɹ/ allophony grew up. . .

Possible “ironed out” conventionalized /ɹ/ allophony patterns:

- ▶ /ɹ/ is retroflex in onsets (like English /l/).
- ▶ /ɹ/ is retroflex next to labials and word boundaries.
- ▶ /ɹ/ is retroflex next to back vowels.

If /ɹ/ allophony grew up...

Possible “ironed out” conventionalized /ɹ/ allophony patterns:

- ▶ /ɹ/ is retroflex in onsets (like English /l/).
- ▶ /ɹ/ is retroflex next to labials and word boundaries.
- ▶ /ɹ/ is retroflex next to back vowels.
- ▶ /ɹ/ is retroflex between labials and back vowels.

If /ɹ/ allophony grew up. . .

Possible “ironed out” conventionalized /ɹ/ allophony patterns:

- ▶ /ɹ/ is retroflex in onsets (like English /l/).
- ▶ /ɹ/ is retroflex next to labials and word boundaries.
- ▶ /ɹ/ is retroflex next to back vowels.
- ▶ /ɹ/ is retroflex between labials and back vowels.
- ▶ /ɹ/ is retroflex in onsets between labials and back vowels.

In the absence of social convergence. . .

- ▶ Each speaker must create a new idiosyncratic sound pattern.

In the absence of social convergence. . .

- ▶ Each speaker must create a new idiosyncratic sound pattern.
- ▶ These patterns resemble each other to the extent that:
 - ▶ variants are easily produced with a human vocal tract
 - ▶ they have the same acoustic result (e.g. low F3)

In the absence of social convergence. . .

- ▶ Each speaker must create a new idiosyncratic sound pattern.
- ▶ These patterns resemble each other to the extent that:
 - ▶ variants are easily produced with a human vocal tract
 - ▶ they have the same acoustic result (e.g. low F3)
- ▶ Idiosyncratic sound patterns: the pool of variation from which new conventional patterns could be drawn

The eternal youth of /ɹ/ allophony...

Many possible /ɹ/ allophony patterns.

The eternal youth of /ɹ/ allophony...

Biased toward phonetically natural ones.

The eternal youth of /ɹ/ allophony...

Only the acoustic properties (low F3) can gain social significance.

The eternal youth of /ɹ/ allophony...

Perceptually, there is no evidence of articulatory differences.

The eternal youth of /ɹ/ allophony...

Articulatorily, /ɹ/ allophony is stuck at an early stage.

Getting stuck in the pool of variation means...

- ▶ /ɹ/ allophony is stuck at an early stage of its development

Getting stuck in the pool of variation means...

- ▶ /ɹ/ allophony is stuck at an early stage of its development
- ▶ No convergence on a common pattern

Getting stuck in the pool of variation means...

- ▶ /ɹ/ allophony is stuck at an early stage of its development
- ▶ No convergence on a common pattern
- ▶ No simplification

Getting stuck in the pool of variation means...

- ▶ /ɹ/ allophony is stuck at an early stage of its development
- ▶ No convergence on a common pattern
- ▶ No simplification
- ▶ Variants of the pattern still tend to be phonetically natural.

Implication for other sound patterns

- ▶ Different sound patterns can emerge in response to the same phonetic motivation (depending on which variant is ultimately conventionalized).

Implication for other sound patterns

- ▶ Different sound patterns can emerge in response to the same phonetic motivation (depending on which variant is ultimately conventionalized).
- ▶ Different speakers can have different phonetic motivations.

Implication for other sound patterns

- ▶ Different sound patterns can emerge in response to the same phonetic motivation (depending on which variant is ultimately conventionalized).
- ▶ Different speakers can have different phonetic motivations.
- ▶ Sound patterns can be both phonetically natural and complex.

Implication for other sound patterns

- ▶ Different sound patterns can emerge in response to the same phonetic motivation (depending on which variant is ultimately conventionalized).
- ▶ Different speakers can have different phonetic motivations.
- ▶ Sound patterns can be both phonetically natural and complex.
- ▶ Phonetic naturalness and simplicity can be byproducts of the development of a sound pattern.

Implication for other sound patterns

- ▶ Different sound patterns can emerge in response to the same phonetic motivation (depending on which variant is ultimately conventionalized).
- ▶ Different speakers can have different phonetic motivations.
- ▶ Sound patterns can be both phonetically natural and complex.
- ▶ Phonetic naturalness and simplicity can be byproducts of the development of a sound pattern.
- ▶ They need not emerge together.

Thank you
