In order to figure out its meaning, however, the non-native speaker has to cross-reference it with the dictionary. Thus in the context of a dictionary, which is the lexicographical book in which a vocabulary and grammatical rules are collected, and the user is engaged in finding the meaning of a particular word, the dictionary is a tool for determining the meaning of a word. The dictionary is a tool for finding the meaning of a word. It is a tool for finding the meaning of a word. To find out the meaning of a word, one must look it up in the dictionary. The meaning of a word is found in the dictionary.

I have two general issues to raise about the way the dictionary is used. Firstly, there is the question of the form, and then there is the question of the meaning. Forms are standard and fixed, whereas meanings are at least partly open to interpretation. The meanings of words are found in the dictionary, whereas the forms of words are not. The meanings of words are found in the dictionary, whereas the forms of words are not.

Boyle and Lecumberri have rightly pointed out that the meaning of a word is not just its dictionary form. The meaning of a word, they say, is its context, and the context in which a word is used is crucial to its meaning. The context in which a word is used is crucial to its meaning.
